

The PAMIC Filter

The Camfil Farr APC PAMIC filter is constructed of a pleated paper media with molded ends and a perforated paper liner. The PAMIC filter acts as a shield for the differential pressure device. It connects to the inside of the dust collector via a 1/8" threaded pipe nipple. This filter keeps dust and trash out of the poly tubing line while maintaining an even and accurate pressure drop reading across the dirty side of the dust collector. The dimensions of this filter are 2.25"OD x 4.25"L with a single open and closed end.
